

PC-10000DC TEST !

08-October-2026

The **TEST** of our PC-10000DC power conditioner by "AudioMuzoFans" (10-2026).

Get More From Your System

A power conditioner tested by **AudioMuzoFans**, allowing your audio system to reveal its full potential.

PC-10000DC is an advanced power conditioner that combines mains interference filtering, a DC blocker, four independent filtering sections, a toroidal transformer, and linear USB power supply. The design is complemented by comprehensive protection features and an anti-vibration isolation system.

What matters most, however, is what happens during listening. After connecting the system, **AudioMuzoFans** noted greater clarity, improved separation and a more expansive soundstage. The presentation also gained more freedom, air and calm between individual sounds.

Importantly, the conditioner does not attempt to change the character of the system. Instead, it allows the system to make better use of its potential by reducing the impact of interference and revealing more information from recordings. The editorial team also noted greater consistency of the sound and more stable operating conditions for the connected equipment.

"We particularly liked the real-time power consumption monitoring function. It is a very practical solution, as by connecting additional devices we can easily check how much electrical energy each one actually consumes at every stage of its operation."

The soundstage is another strong point - it becomes wider, more organized and more tangible, while elements further back in the mix are easier to follow.

"It simply allows the system to reveal more of what is already there - more silence, space, separation and calm."

AudioMuzoFans awarded the **PC-10000DC** its recommendation, highlighting that the conditioner does not alter the character of the system, but allows it to reveal additional layers of quality.
