

29-October-2018

A rave review of our new PF-2000 power filter in the “Stereo i Kolorowo” magazine.

Listening impressions

“The function of filtering electricity network impurities is performing perfectly and at the same time neither limiting nor “muffling” the sound. It works like a patch to a wound.

The sound of the system connected to the TAGA Harmony filter shows up as clean and open, direct and wide, strong and of high resolution. The influence of the PF-2000 on the sound is best displayed in the improvement of image details, the tangibility of the scene and a better definition of the lower bass. You can also find increased selectivity and resolution of the message. Blurred parts of recordings are evidently stronger and more visible. More readable. These are not big changes, but explicit and clear. Indisputable.

Of course, I do not mention this blessed effect of the PF-2000 filter on the sound like no audible overvoltage, glitches or so-called crackling, because it's understandable. There are also no noises and other interference audible. The PF-2000 fulfills these tasks excellently. Nothing more nothing less...

The effect on the sound is obvious - the overall musical image is improved, the details become clearer and the sound gets more substance and content. I recommend The PF-2000 especially to people who do not have any power filter and are still using the so-called power strip. In such cases, the sound progression will be the highest, and a user satisfaction guaranteed.”
