

THDA-500T

Listening impressions

"... a user receives a decent headphone amplifier and a pure-blooded DAC based on really good components. And undoubtedly it can be heard!

The headphone amplifier operates in the class A. It provides clean, rich and massive sound. The sound is flat and harmonious, very well arranged in the space. Taga Harmony has a good ability to emphasize sound contours, completing their interiors and ballasting them tonally. This results in a strong and energetic message, but at the same time direct and tangible. Leading in the direction of elegance and culture. Excellent smoothness and sophistication...

*It transfers audio signals from a connected computer to a higher level of digital sound. The sound is splendidly arranged, neat and clean - neutral but aimed towards physiological warmth and energy, what brings a high level of engagement and genuine listening pleasure. **Revelation.***

Conclusion

The summary in this case will be very short. For this price a listener receives really a lot. That is the first-class, high-grade sound provided by the headphone amplifier and as a bonus - the high resolution and spatial sound converted via the built-in USB DAC.

*Warning! The Taga Harmony THDA-500T plays much better than it looks. Do not be fooled by its economical design, it is a real blockbuster in the audio hi-fi category. **I recommend it.***
