DC-100 TEST !

WSTEREO.PL

16-January-2026

The **TEST** of our DC-100 DC Blocker by "Wstereo" (01-2026).

Small device, big difference

Wstereo points out that the DC Blocker is an accessory that does not interfere with the sound character, yet can noticeably improve listening comfort. Particular attention is given to the reduction of transformer hum and a clearly cleaner sound presentation.

After connecting the DC-100, the system gains a greater sense of calm and order. A more pronounced "black background" appears between sounds, resulting in improved separation and clarity. The sound becomes more direct, with details easier to perceive, all without any change in tonal balance.

As Wstereo emphasizes, "TAGA Harmony DC-100 does not change the tonal balance - instead, the sound becomes cleaner, more selective and more direct." It is a solution especially recommended for users dealing with transformer noise or those looking to improve the overall performance and culture of their audio system.

"Definitely worth trying" - as the result may come as a pleasant surprise.
